TODO: the experiment on different lr of freezed encoder model part has disappeared, fix it

▼ Datasets

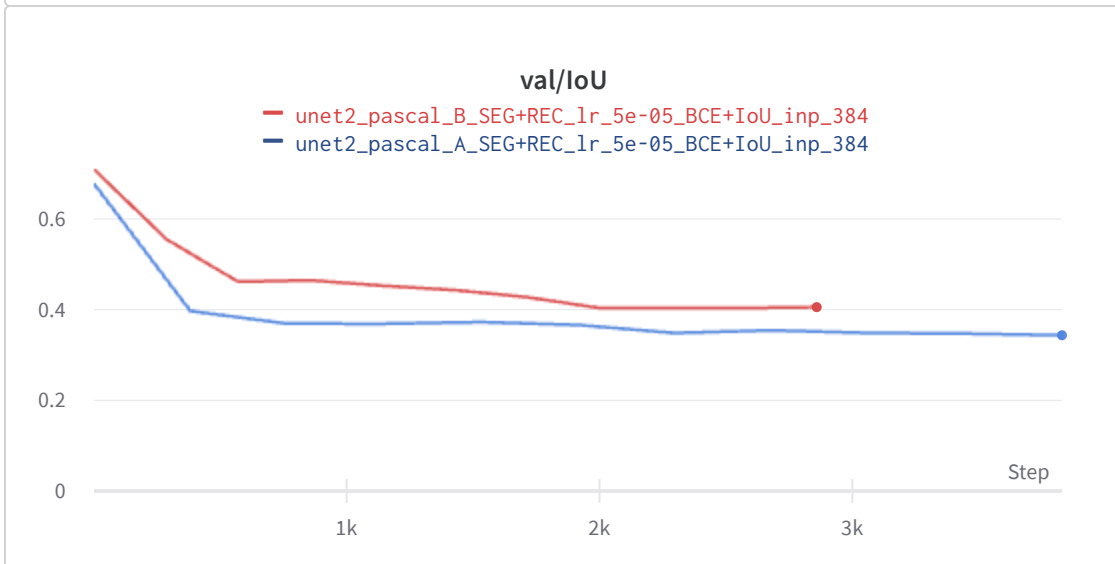

Models here are trained on the Pascal VOC segmentation dataset. The segmentation model is class-agnostic, trained on images cropped around ground truth objects.

There are two datasets subsets, called A and B. Those were created by sorting the classes according to the number of training examples. When ranked from 1 to 20, even classes are put to subset A, odd to subset B.

A = ['person', 'car', 'cat', 'bottle', 'tvmonitor', 'train', 'pottedplant', 'boat', 'horse', 'sheep']

B = ['dog', 'chair', 'bird', 'aeroplane', 'bicycle', 'diningtable', 'motorbike', 'sofa', 'bus', 'cow']

▾ Healthy Training Curves Example:

val_ims/in1

unet2_pascal_B_SEG+REC_lr_5e-05_BCE+I...

unet2_pascal_A_SEG+REC_lr_5e-05_BCE+I...

val_ims/in0

unet2_pascal_B_SEG+REC_lr_5e-05_BCE+I...

unet2_pascal_A_SEG+REC_lr_5e-05_BCE+I...

val_ims/out2

unet2_pascal_B_SEG+REC_lr...

unet2_pascal_A_SEG+REC_lr...

Step  3829 

val_ims/out1

UNET2_PASCAL_B_SEG+REC_LR...

UNET2_PASCAL_A_SEG+REC_LR...

Step  3829 

val_ims/out0

UNET2_PASCAL_B_SEG+REC_LR...

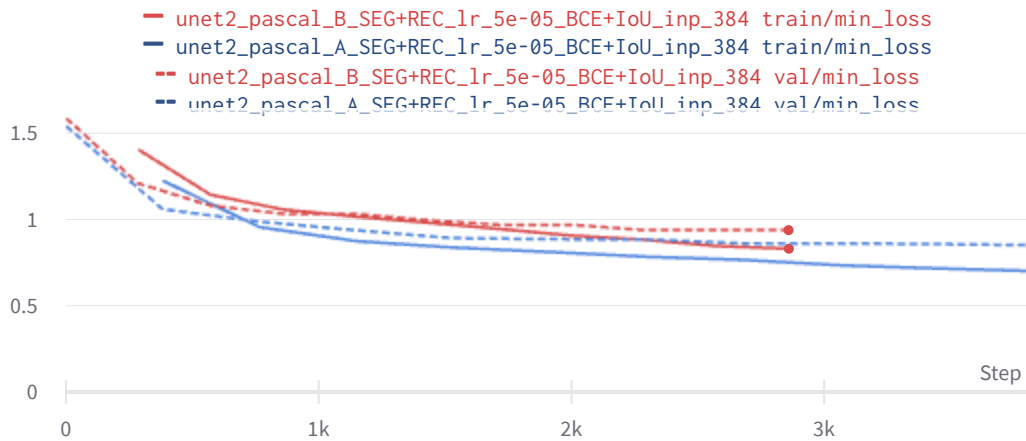

UNET2_PASCAL_A_SEG+REC_LR...

Step  3829 

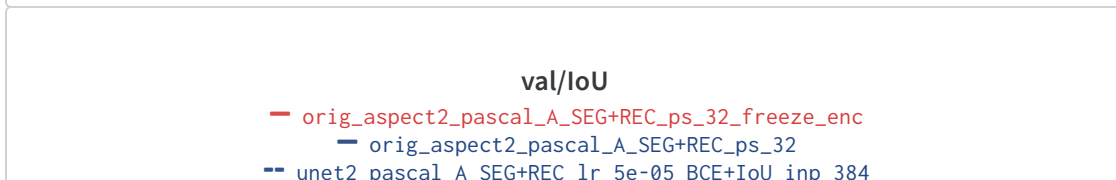

train/min_loss, val/min_loss

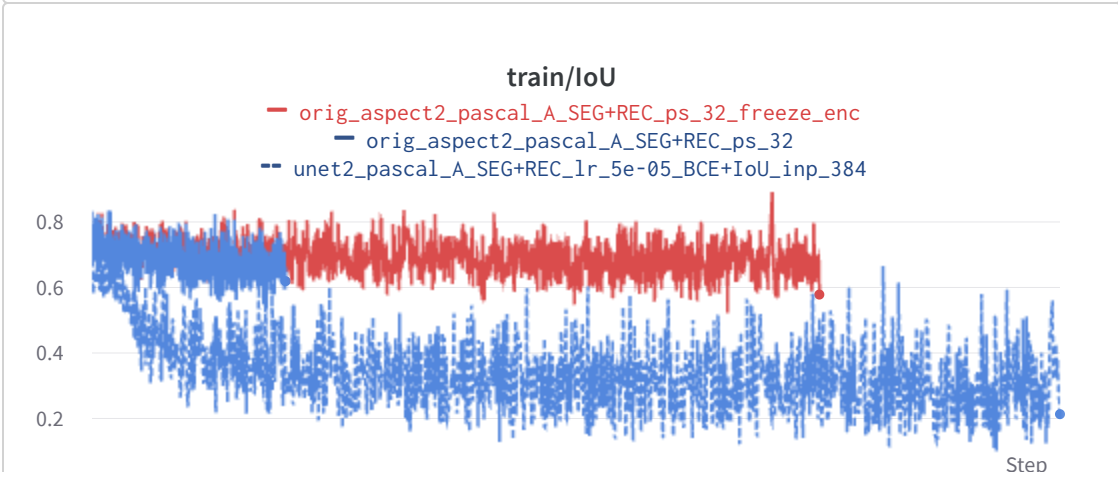

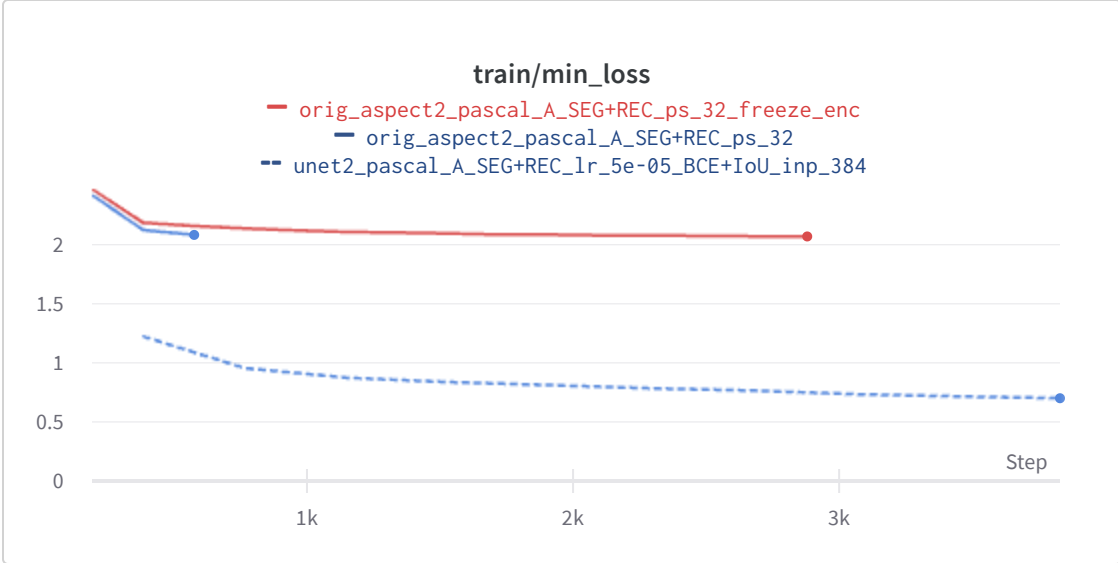

▾ On the importance of pre-trained model and loading weights properly

When we do not load the positional encoding:

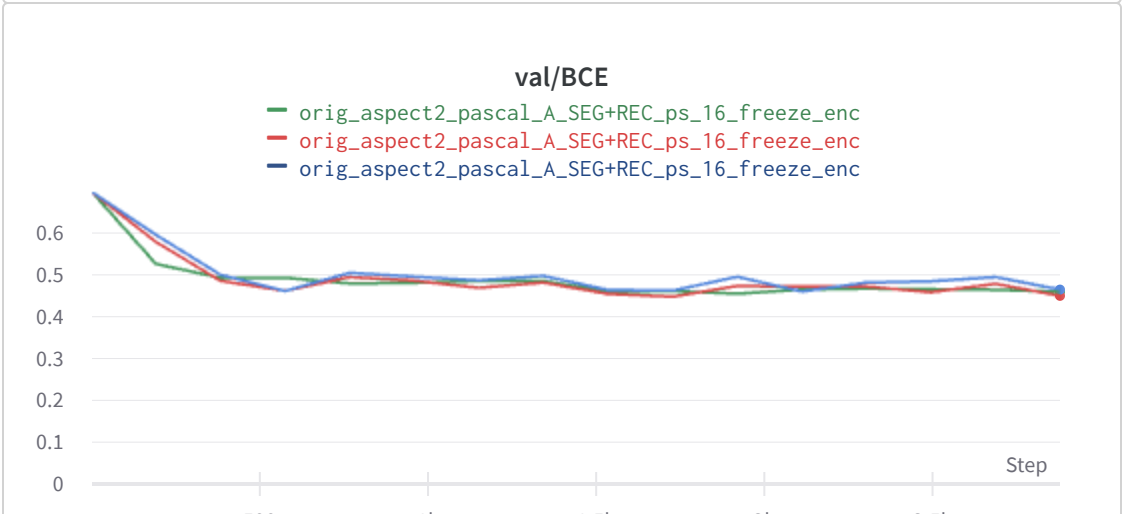

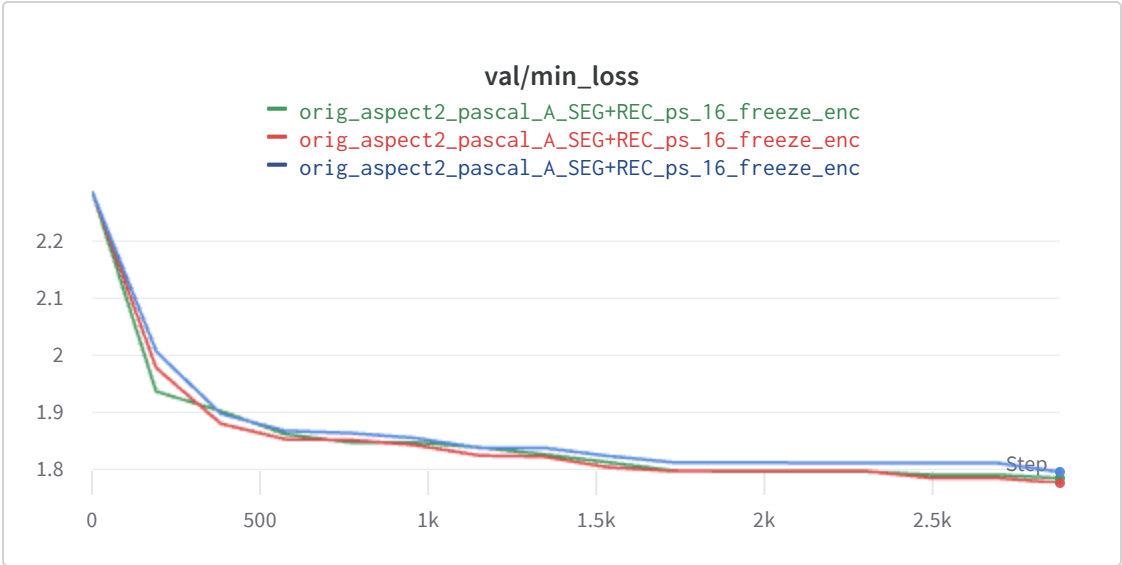

When we change patch size and thus need to train patch embedding vs loading pre-trained weights:

Experimenting with different learning rates when altering patch size
 - doesn't really help:

500

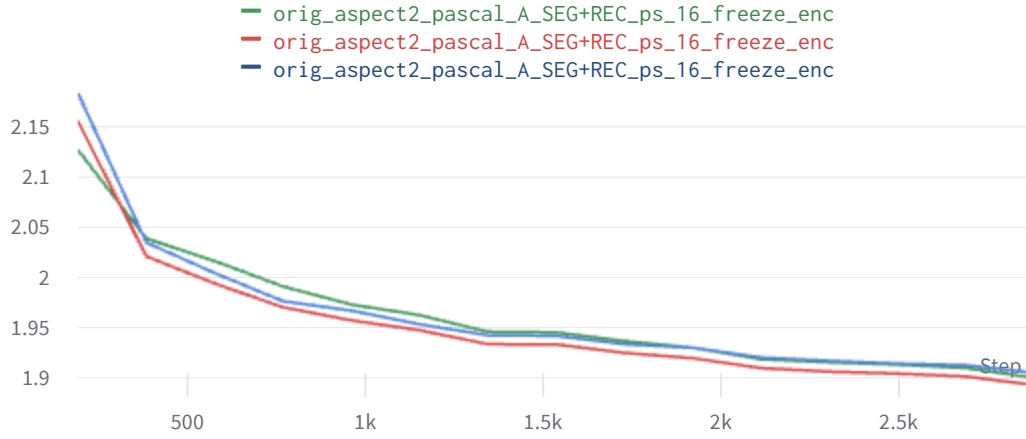

1k

1.5k

2k

2.5k

train/min_loss

train/loU

train/BCE

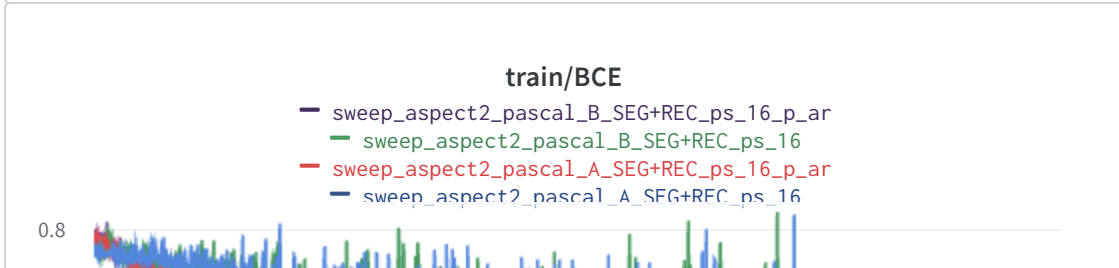

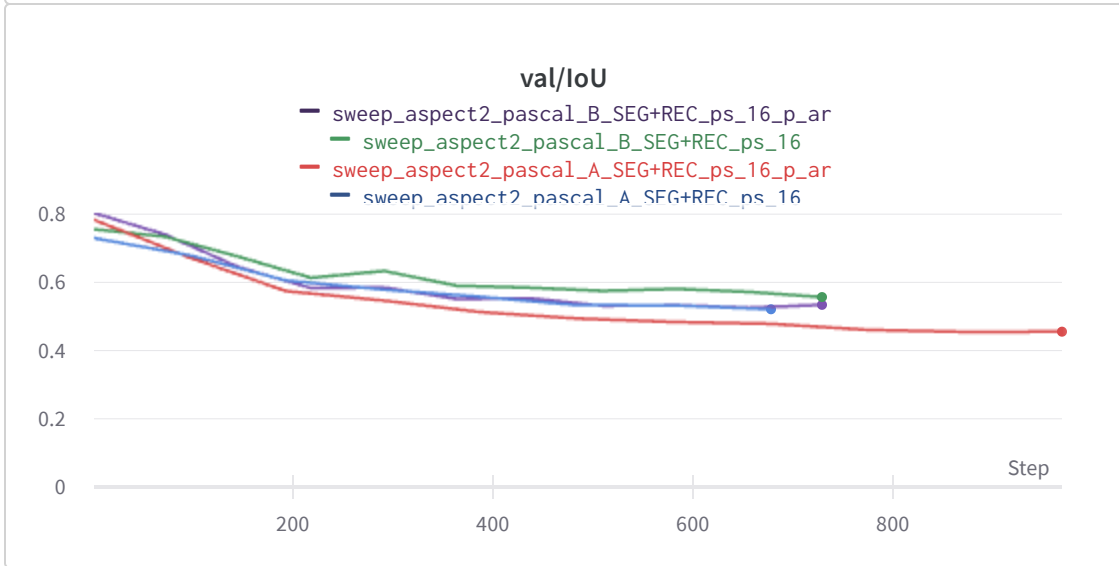

lr

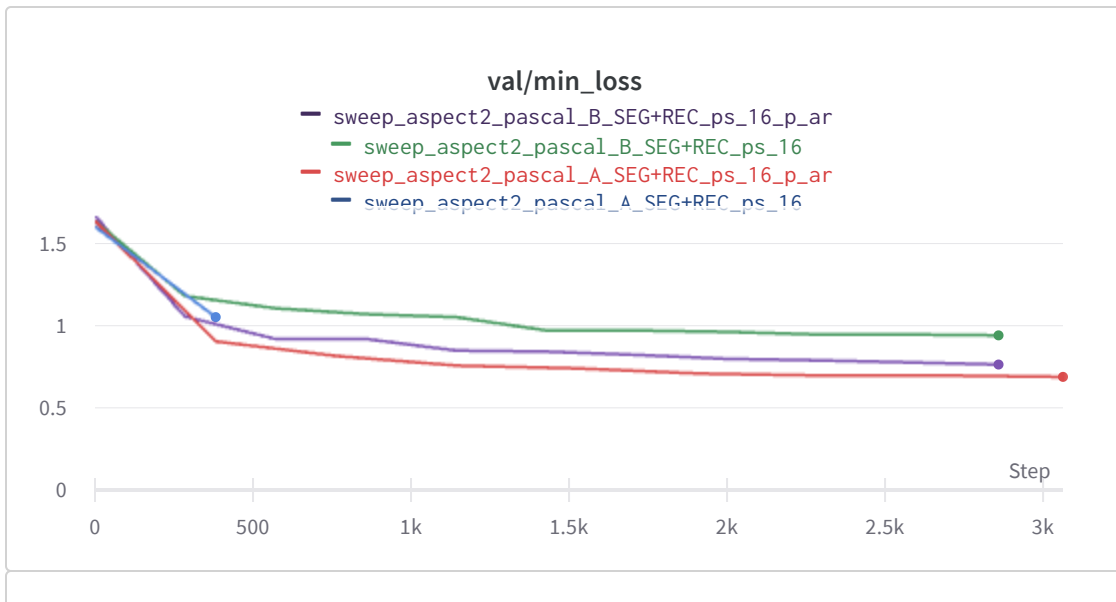

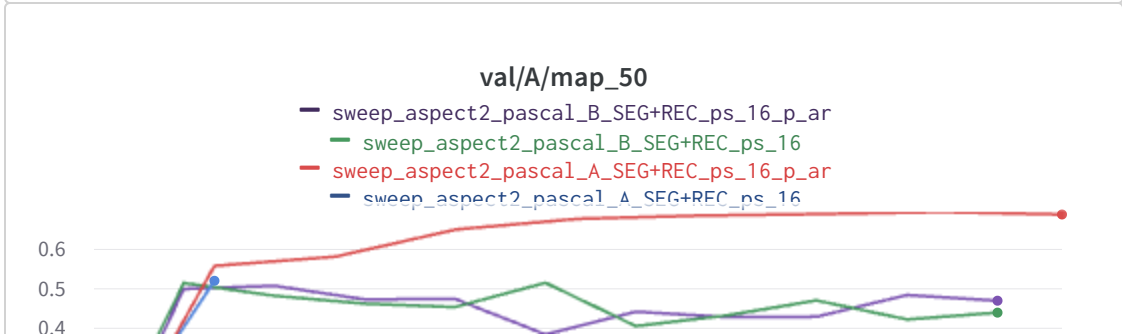

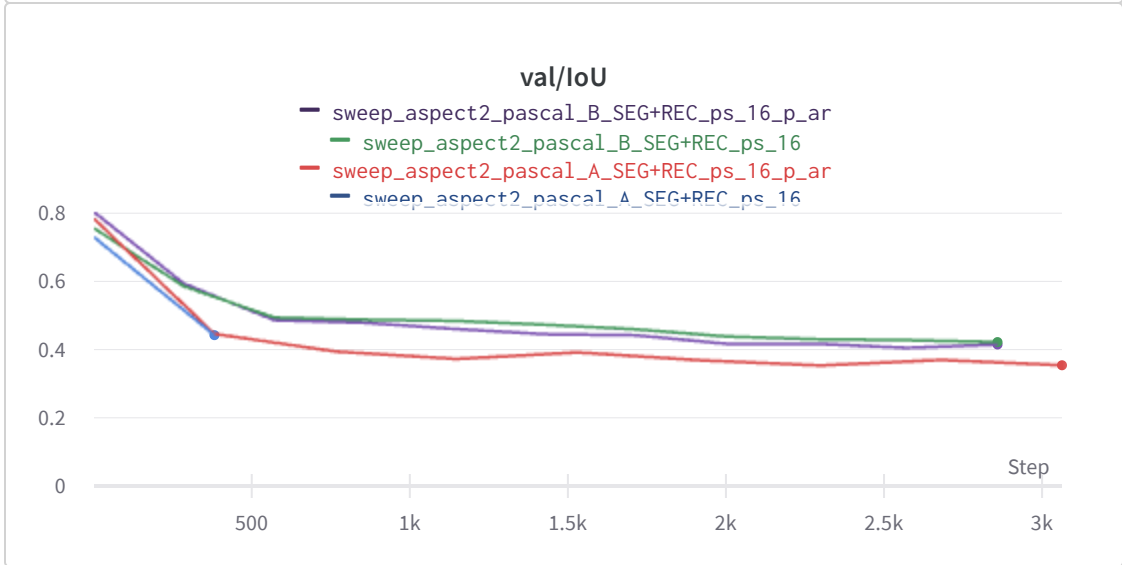

When there was a mistake in facebook-pretrained to our model weight name matching and the positional encoding didn't get loaded - the weights of the positional encoding were set to `require_grad=False` so not trained.

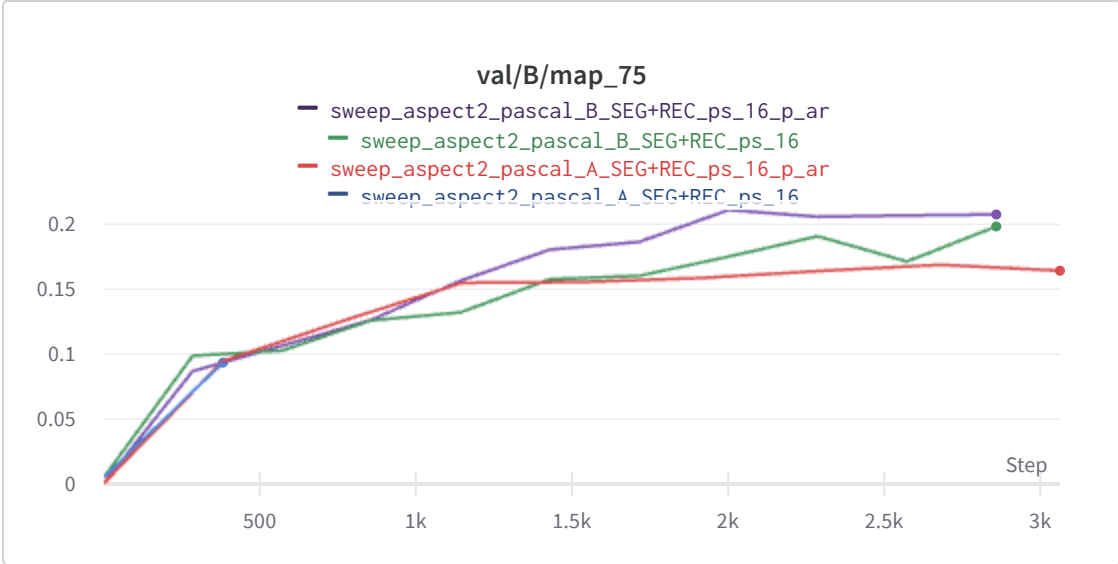

► Different subset cross evaluation + aspect ratio impact

Run set 4 ⋮

Created with  on Weights & Biases.
