Bydlení v centru Prahy, dostavba holešovického pivovaru

Conception

The project focuses on the development of a residential building in the heart of Prague, in the district of Holešovice. The goal is to create a modern and sustainable living environment that respects the historical context of the area. The building will feature a mix of private apartments and public spaces, designed to promote social interaction and community engagement.

The design is based on the principles of sustainability, energy efficiency, and user comfort. The building will include green spaces, such as gardens and rooftop terraces, to provide residents with a connection to nature. The materials used will be environmentally friendly, and the energy systems will be optimized to minimize carbon footprint.

The project aims to set a new standard for residential architecture in the city, appealing to both current and future generations. It is a step towards creating a more sustainable and vibrant urban environment in Holešovice.
