

## **Evaluation of diploma thesis by supervisor**

Submitted diploma thesis with name „Fouling in process apparatuses“ was written by Rahul Kumar Gautam. The thesis deals mainly with literature survey concerning the fouling, its creation, i.e. process of forming of a dirt layer on a heat transfer surface, and its influence on the design of industrial apparatuses.

The thesis is written by simple and rather clear form and contains not so much formal and factual errors and inaccuracies. Author almost accomplished the given tasks. I would expect a little more systematic and deeper approach in author's work.

I appreciate the thesis with evaluation, taking into account author's previous ongoing work,

C (good).
